

for loop

for vs. while loop

The `for` Loop vs. the `while` loop

- Often you will need to execute a sequence of statements a given number of times.

You could use a `while` loop:

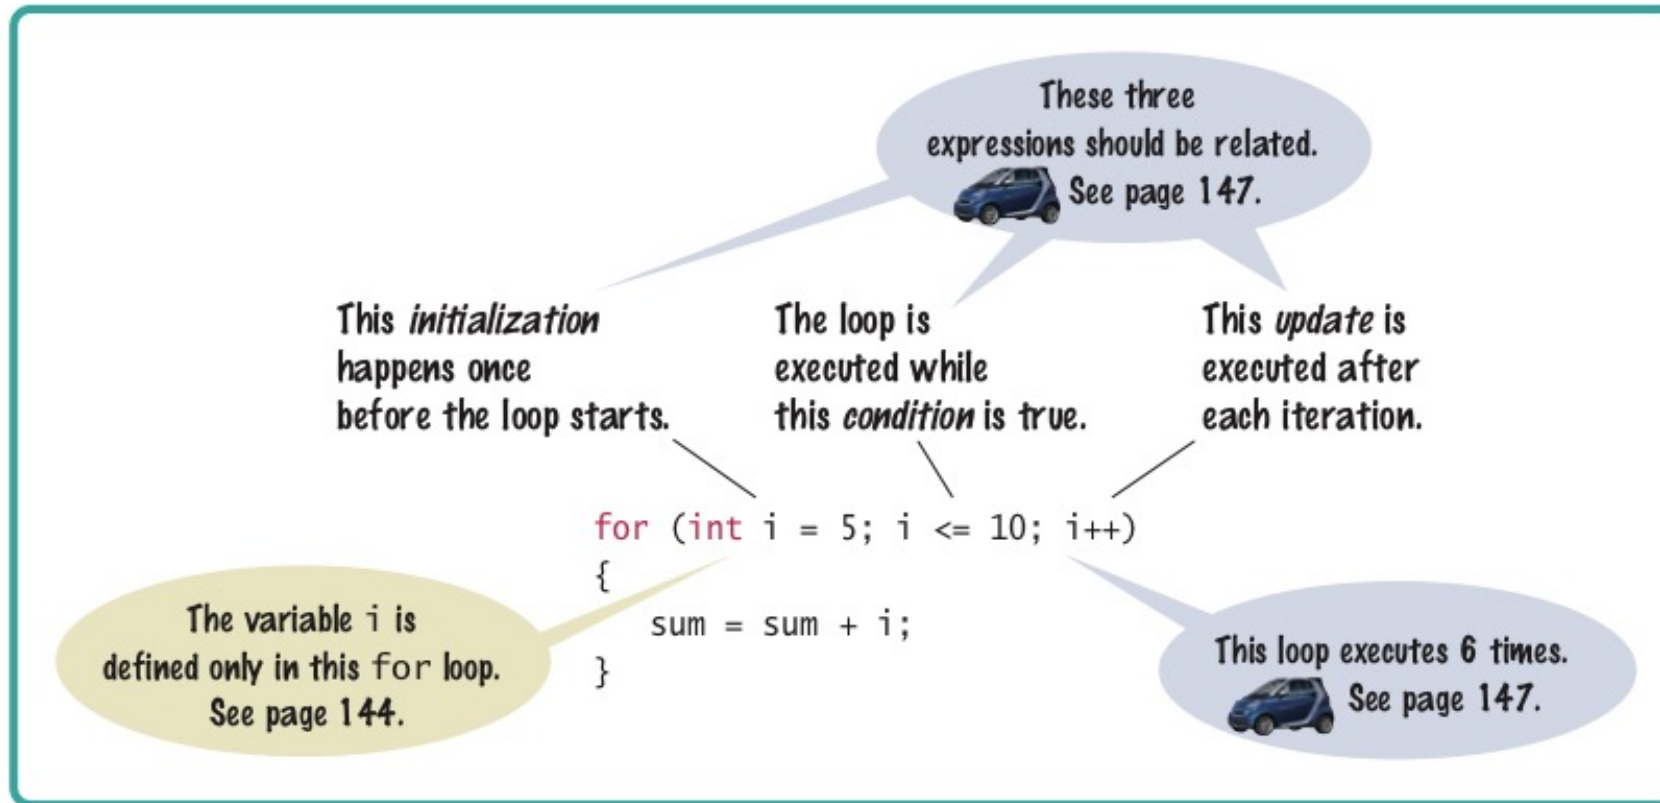

```
num = 1; // Initialize the variable
while (num <= 10) // Check the variable
{
    cout << num << endl;
    num++; // Update the variable
}
```

The `for` Loop

- C++ has a statement custom made ***for*** this sort of processing: the **`for`** loop.

```
for (num = 1; num <= 10; num++)  
{  
    cout << num << endl;  
}
```

The `for` Loop Syntax

The `for` Loop Is Better than `while` for Certain Things

- Doing something a known number of times or causing a variable to take on a sequence of values is so common, C++ has a statement just for that:

```
for (int count = 1; count <= 10; count++)  
{  
    cout << count << endl;  
}
```

The diagram illustrates the four components of a C++ `for` loop. Three blue arrows point from labels at the bottom to the corresponding parts of the loop header: `int count = 1` is labeled initialization, `count <= 10` is labeled condition, and `count++` is labeled update. A black arrow points from the label statements to the loop body `cout << count << endl;`.

for () loop execution

```
for (initialization; condition; update)
{
    statements;
}
```

- The **initialization** is code that happens once, before the check is made, to set up counting how many times the *statements* will happen. The loop variable may be created here, or before the `for ()` statement.
- The **condition** is a comparison to test if the loop is done. When this test is false, we skip out of the `for ()`, going on to the next statement.
- The **update** is code that is executed at the bottom of each iteration of the loop, immediate before re-testing the condition. Usually it is a counter increment or decrement.
- The **statements** are repeatedly executed until the condition is false. These also are known as the "loop body".

The `for` Can Count Up or Down

- A `for` loop can count down instead of up:

```
for (int counter = 10; counter >= 0; counter--)
```

- Notice that in this examples, the loop variable is defined **in** the *initialization* (where it really should be!).

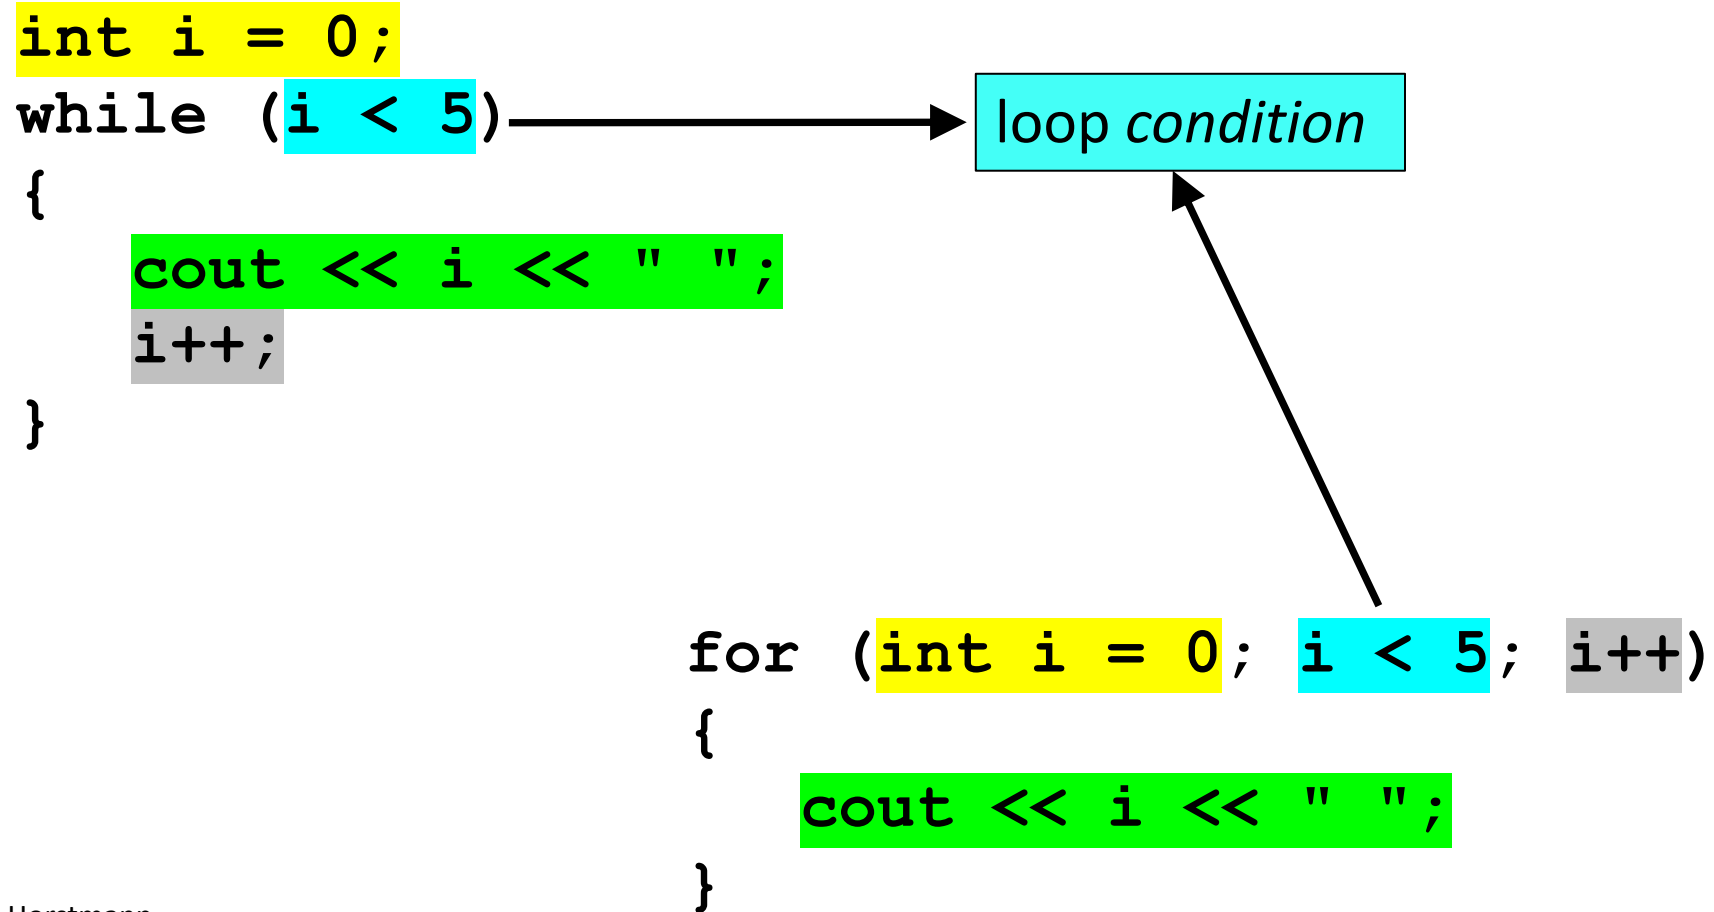

Converting from a *while* loop to a *for* loop

```
int i = 0;  
while (i < 5)  
{  
    cout << i << " ";  
    i++;  
}
```

initialize loop variable *i*:
ONLY ONCE!

```
for (int i = 0; i < 5; i++)  
{  
    cout << i << " ";  
}
```

Converting from a *while* loop to a *for* loop

Converting from a *while* loop to a *for* loop

```
int i = 0;  
while (i < 5)  
{  
    cout << i << " ";  
    i++;  
}
```

update loop
variable *i*

```
for (int i = 0; i < 5; i++)  
{  
    cout << i << " ";  
}
```

Converting from a *while* loop to a *for* loop

```
int i = 0;  
while (i < 5)  
{  
    cout << i << " ";  
    i++;  
}
```

cout << i << " ";
i++;

loop body

```
for (int i = 0; i < 5; i++)  
{  
    cout << i << " ";  
}
```

cout << i << " ";
